Engineering internship report conclusion

After completing my industrial training, I had been exposed to an IT technician and programmer's working life. During my internship I could learn more about defining an IT technician and programmer and prepare myself to become a responsible and innovative technician and programmer in the future. During my training I find that observing is a major element to find out the root cause of a problem. Not only for my project but also daily activities too. During my project, I work with my colleagues and operators to determine the problems. Also, the project indirectly helps me learn independently, discipline myself, be considerate, be confident, take initiative and have the ability to solve problems. In addition, my communication skills are also enhanced when communicating with others. During my training, when mistakes were made, I received criticism and advice from engineers and technicians. However, those recommendations are useful guidance for me to change myself and avoid myself making the same mistakes again. Other than that, I had developed my programming skills through the various programs I had done. It also helps sharpen the skills I've had in 2013 than most programs were done with the help of Visual Studio 2013. Overall, the activities I learned during industrial training are really helpful for me in the future to face challenges in a workplace. During industrial training, I realized that there are a few important things: critical and analytical thinking to organize our tasks and assignments, we need to analyze our problems and assignments and develop a good solution to the problem. We need to set out a contingency plan for a solution, to be well prepared for unpredictable situations. As key technicians and programmers always race against tight timelines and packed schedules, management minimizes the right time facing an overdue deadline. Effective time management allows us to perform our assignment efficiently and meet our plans. Timing avoids wastage time and allows us to plan ahead, and gain more as a result. Opposing a Herculean goal seemed accessible at first glance, it is better to divide goals into a few achievable tasks, so that by performing those tasks we will gain more confidence. In the workplace, teamwork is vital in helping a strong organization. Teamwork is also essential in achieving the goals of the organization as an institution. In this way, communication and sharing in the workplace is much needed. So we have to respect each other at work, and work together as a team instead of working alone. This is because it's easier to work together as a team in achieving our goals, rather than operating individually. I would like to once again appreciate anyone who has made my industrial training a wonderful experience writing an internship report is a relatively easy job to accomplish. It's just supposed to discuss the company, industry, or organization briefly and describe what you learned there as an intern. How do you think this internship changes your perspective on the workplace and what you do in terms of refining your professional skills. On the flip side, the conclusion of the internship report can be a bit tricky. As with all sorts of conclusions, you're not supposed to add anything out of the blue to the concluding section, however, you need to talk about something worthwhile and doesn't seem repetitive. Here's how you can achieve this: In the conclusion section of your apprenticeship report you can talk about the whole apprenticeship experience. You can also include what kind of skills or features you'd like to develop or work more on. What areas of the
